

A Silly Inventor

Dr Silly was an inventor. He liked inventing things even though he never made anything work. One day, he wanted to make a robot. He used a saw to cut some wood. It could be good to put outside the robot's toe to make a nicer look.

Then, he got something like steal, glass, wires, a source of power and light bulbs. He used the steal for legs and arms but not feet or hands. He used the glass to make the head and also used wires to be transport power; the source of power was to charge it. Then he put a light bulb in and connected the wires to it so it can glow in the dark. He used plastic to make hands and feet and the remote control. He asked Dr Anti Silly to see it. He turned it on but it didn't work.

Dr Anti Silly left and didn't help. After a few days, ten more robots that he made, he found the error. It was because he misput the arms. He learnt that he should be more careful.
