

A Silly Inventor

By 5A Chu Tsz Oi Bernice

Dr Silly was an inventor. He liked making silly inventions. One day, he wanted to make a robot that could drive cars. However the result ended up horrible! This was how he made his robot.

Dr Silly got a piece of wood and used a saw to cut it in half. However, the wood was too thin! Then he made the limbs, body and head with metal. After tempering the metal, he wore gloves and bent the metal. During the process, he accidentally burnt his hand!

After sticking the limbs, body and head with duct tape, he made a remote with plastic. He controlled the robot with the remote but there was a flaw within the robot — three arms and one leg! The robot did drive the car, but bumped into some houses and mail boxes.

In the end, Dr Silly and his assistant made a new robot with thicker wood and an extra leg. The robot could drive cars in a straight line! Dr Silly learnt that co-operation is important. Otherwise, he could have destroyed the town!
